5. *Conclusion*

# The EPR™ Nuclear Power Plant

- ▶ Pressurized Water Reactor of generation III+
- ◆ Four units are currently under construction

OLKILUOTO, FINLAND

ENGINEERING & PROJECTS ORGANIZATION

# Radiation Protection at the Design Stages

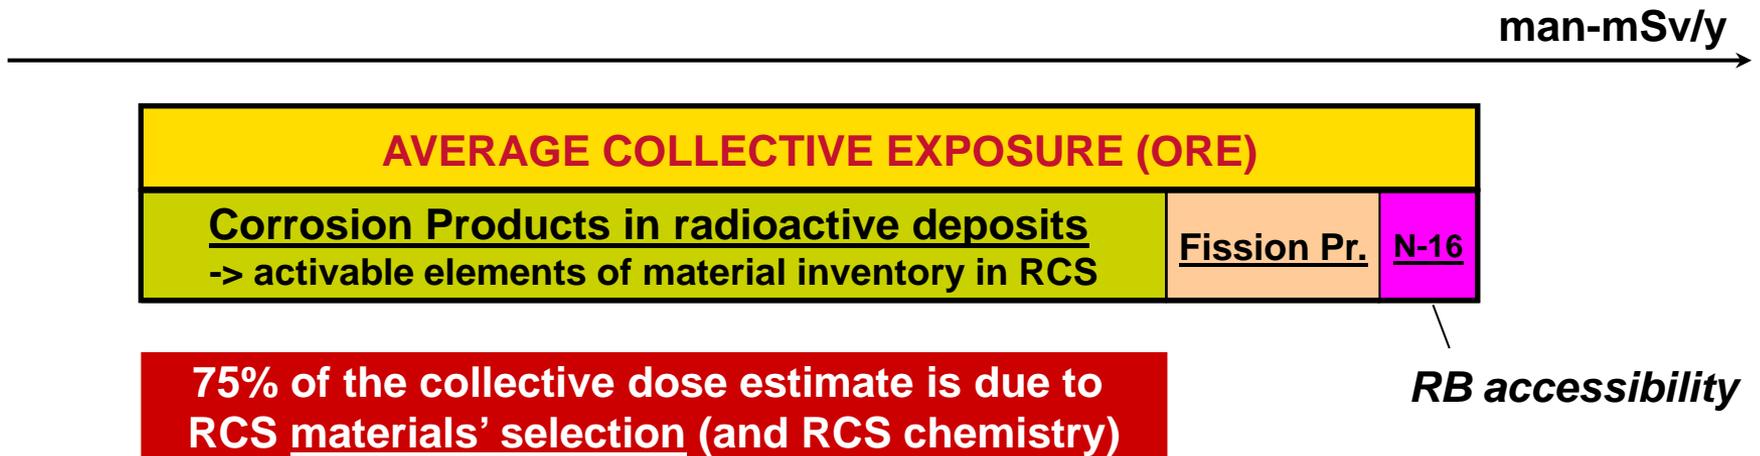

- ▶ **ALARA approach at the design stage of new plants mandatory as of beginning of EPR™ Basic Design in 1995**
  - ◆ **Based on ICRP publication 60**
  - ◆ **National regulations**
    - European level (Directive 96/29)
    - Member countries of reference plants (France, Germany)
  - ◆ **European Utility Requirements (EUR)**
    - Material selection with low release rates
    - Justification of activable species (focus on Cobalt, Nickel)
- ▶ **Adaptation to other regulatory frameworks**
  - ◆ **European countries (UK, ...)**
  - ◆ **Outside Europe (China, USA, ...)**
- ▶ **Second principle of “optimization” = ALARA design**

»» SOME « EVOLUTIONS » WERE SMALL REVOLUTIONS IN DESIGN METHODOLOGY

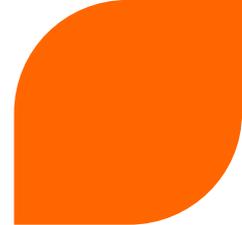

ENGINEERING & PROJECTS ORGANIZATION

# Several Radiation Sources: Where the Effort Should be Made?

## ► Contributions to ORE in EPR™ configuration

**THE SELECTION OR EXCLUSION OF CERTAIN MATERIALS (INCLUDING IMPURITIES) IS ONE ESSENTIAL ASPECT OF RADIATION PROTECTION AT THE DESIGN STAGE**

# Activity Build-Up on Primary Component Surfaces

1. *Introduction*
2. ***Activity Build-Up on Primary Component Surfaces***
3. *Impact of Current EPR™ Material Inventory on Primary Circuit Contamination*
4. *Are Further Improvements in Material Inventory ALARA?*
5. *Conclusion*

# Activity Build-Up of Corrosion Products

## ▶ RCS Wetted surfaces

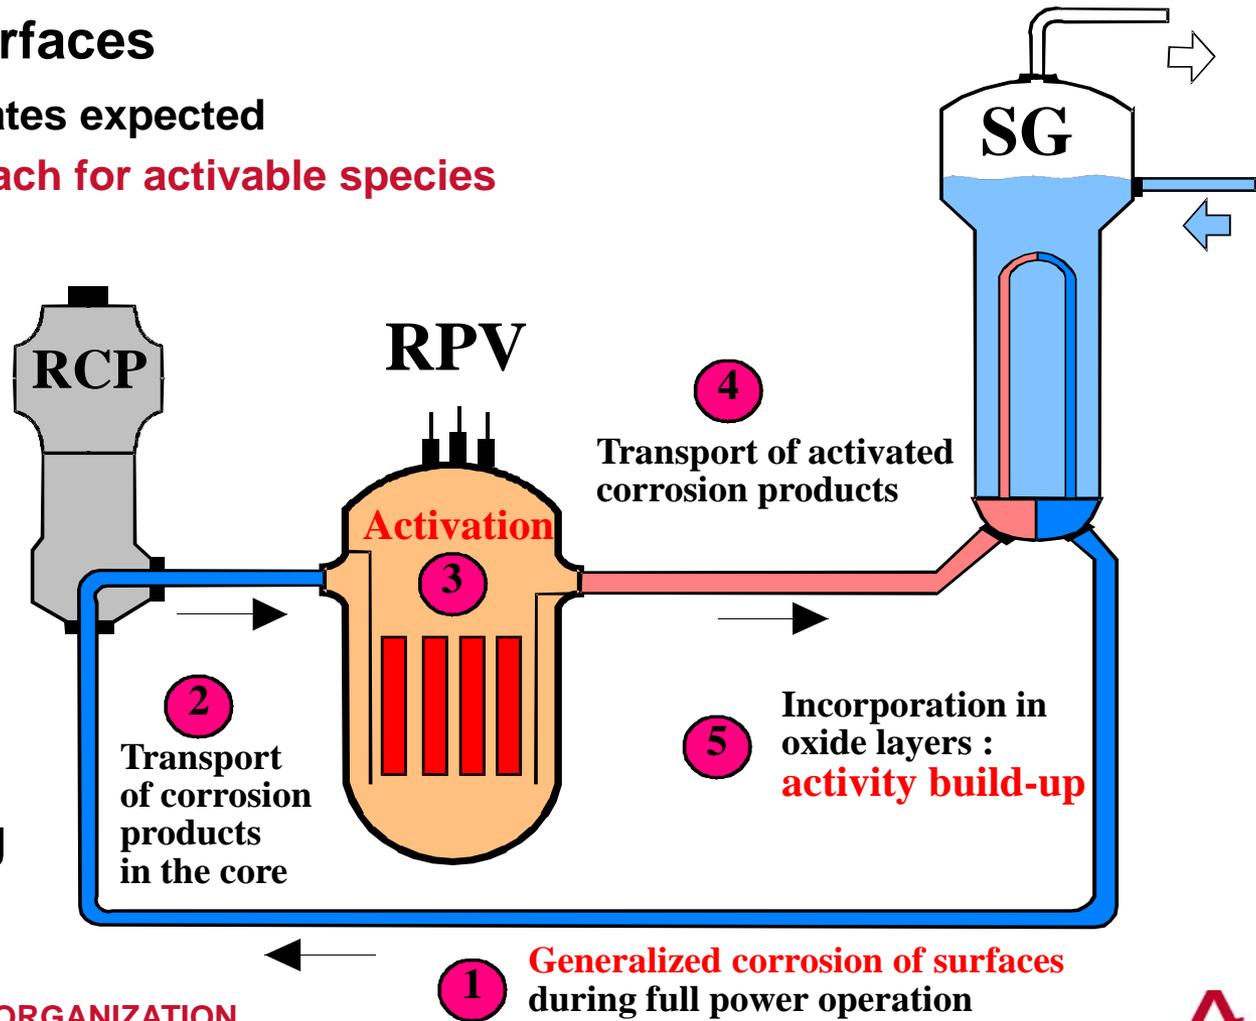

- ◆ Low release rates expected
- ◆ **ALARA approach for activable species**

## ▶ Primary water chemistry minimizes corrosion

- ◆ pH value
- ◆ Hydrogen concentration

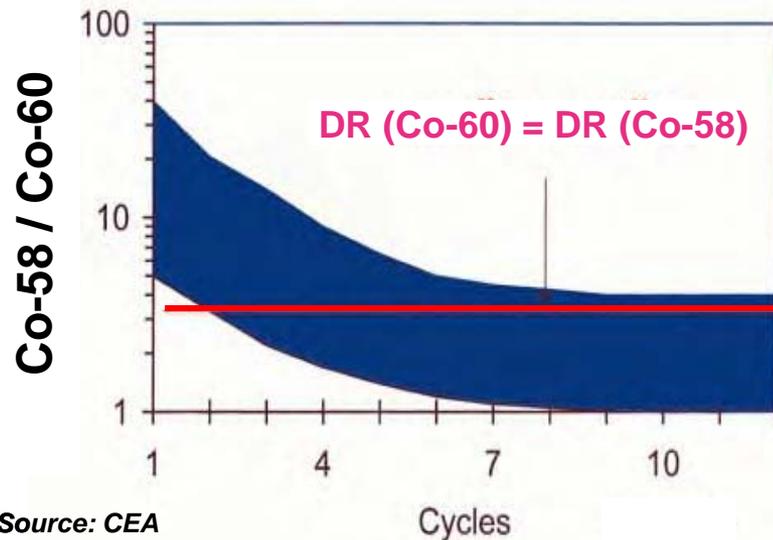

## ▶ Surface conditioning during commissioning

- ◆ Protective oxide layer

# Corrosion Product Contribution to RCS Dose Rates (DR) vs Time

- ▶ Deposits of Co-60 and Co-58 are the dominant contributors to dose rates measured at the vicinity of empty contaminated piping and components

Source: CEA

Major contribution of Cobalt-58 to the DR

Source: Nickel

Major contribution of Cobalt-60 to the DR

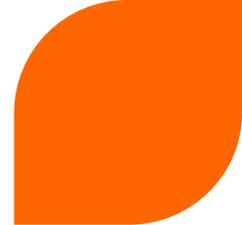

Source: Cobalt

- ◆ **Stellite™ hardfacing parts**
  - Corrosion and wear
- ◆ **Cobalt residual content**
  - General corrosion

**FOCUS ON COBALT INVENTORY AT THE DESIGN STAGE SINCE COBALT-60 IS A LONG-TERM CONTRIBUTOR TO COLLECTIVE DOSES**

**ENGINEERING & PROJECTS ORGANIZATION**

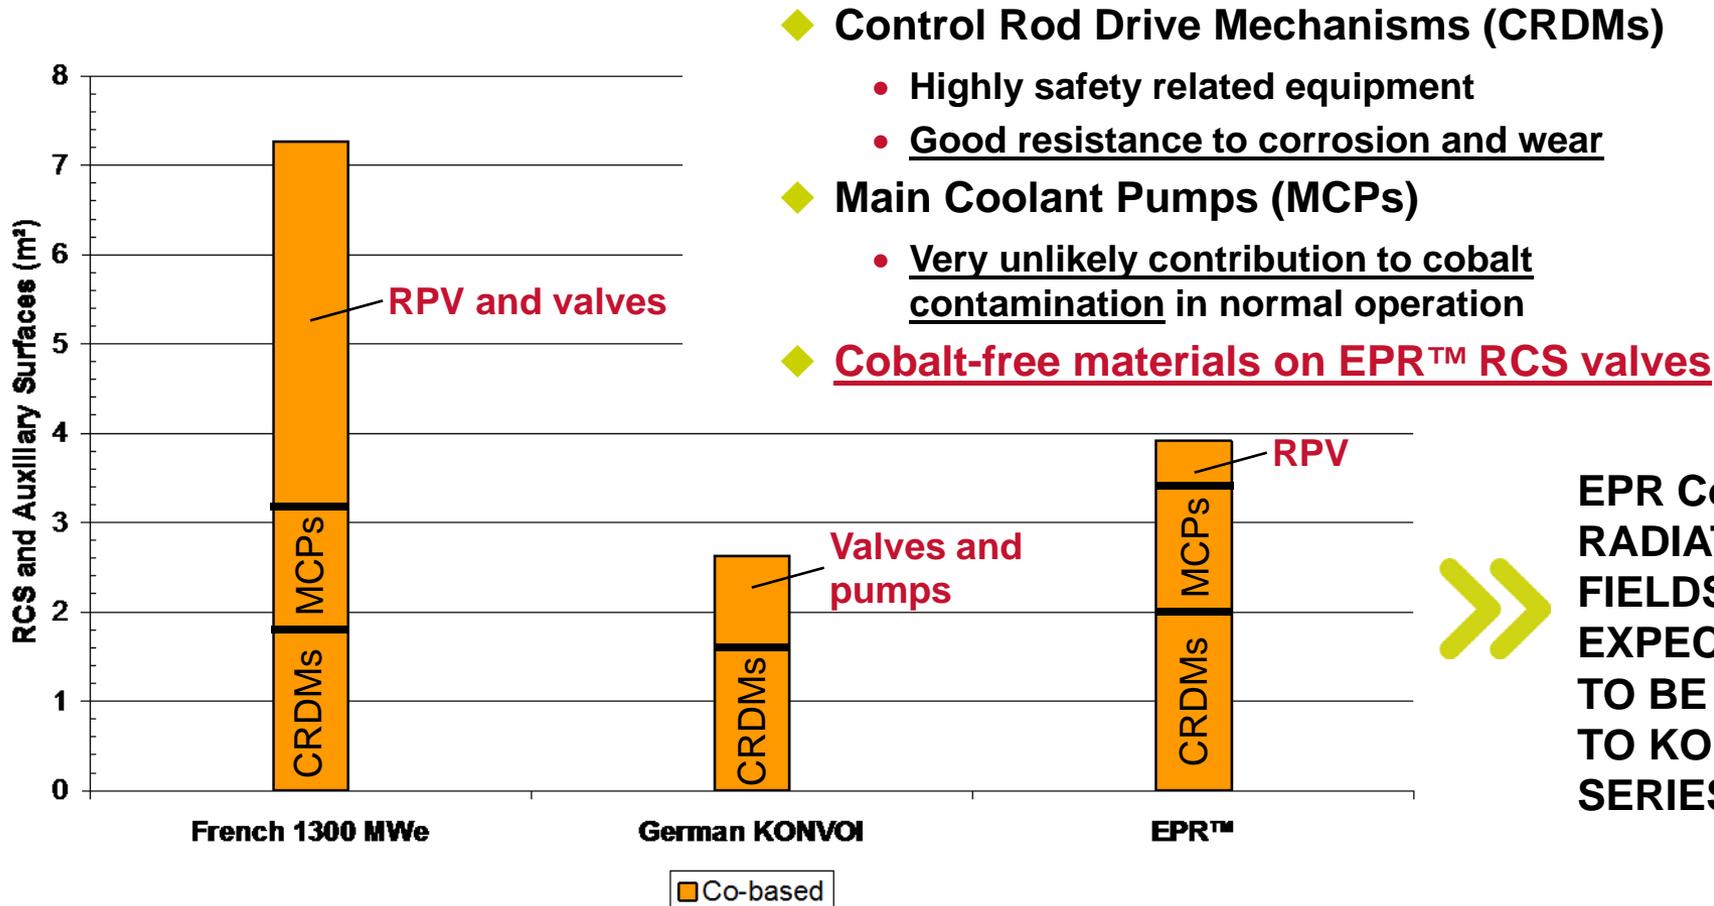

# Impact of Current EPR™ Material Inventory on Primary Circuit Contamination

1. *Introduction*
2. *Activity Build-Up on Primary Component Surfaces*
3. ***Impact of Current EPR™ Material Inventory on Primary Circuit Contamination***
4. *Are Further Improvements in Material Inventory ALARA?*
5. *Conclusion*

# Potential Cobalt-60 Sources from Stellite™ Hardfacing Parts

## ▶ Comparative Stellite™ surfaces between EPR™ and reference plants

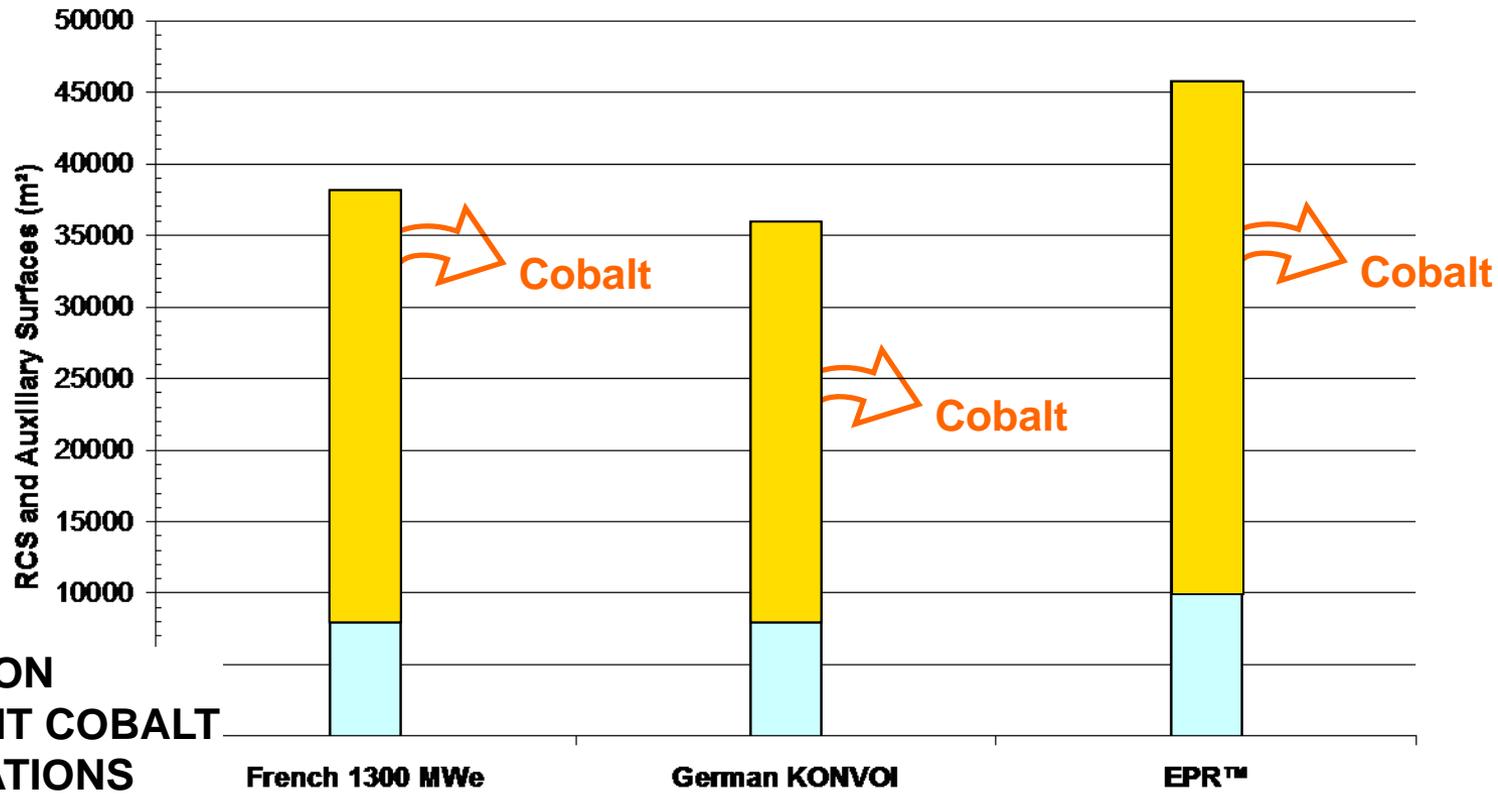

**EPR Co-60 RADIATION FIELDS EXPECTED TO BE CLOSE TO KONVOI SERIES**

**ENGINEERING & PROJECTS ORGANIZATION**

# Potential Cobalt-60 Sources from Cobalt Residual Content in Steels and SG Tubes

## ▶ EPR™ RCS component surfaces

- ◆ Larger surfaces on EPR™ than on reference French and German series

**EFFORTS ON  
EQUIPMENT COBALT  
SPECIFICATIONS**

**ENGINEERING & PROJECTS ORGANIZATION**

□ Zr-based □ RCS wetted components

# ALARA Approach for Primary Components (RPV, Internals and Main Coolant Loops)

- ▶ **Consideration of industrial capabilities according to ALARA**
  - ◆ Optimization of margins between equipment specifications of existing French reference plants (RCC-M) and Cobalt content measurements
  - ◆ Costs from steel makers by additional selection of recycled materials
  - ◆ Different industrial contexts depending on location in the world

| Equipment/ Material                           | Cobalt residual content (%)           |         |
|---|---------------------------------------|---------|
|   | RCC-M requirement                     | EPR™    |
| RPV internals (Stainless steel)               | < 0.2 required,<br>but < 0.1 expected | < 0.06  |
| RPV and pressurizer stainless steel cladding  | < 0.2                                 | < 0.06  |
| Main Coolant Lines and PZR surge line (Steel) | < 0.2 required,<br>but < 0.1 expected | < 0.06  |
| SG tubes (Alloy 690TT)                        | < 0.018                               | < 0.015 |

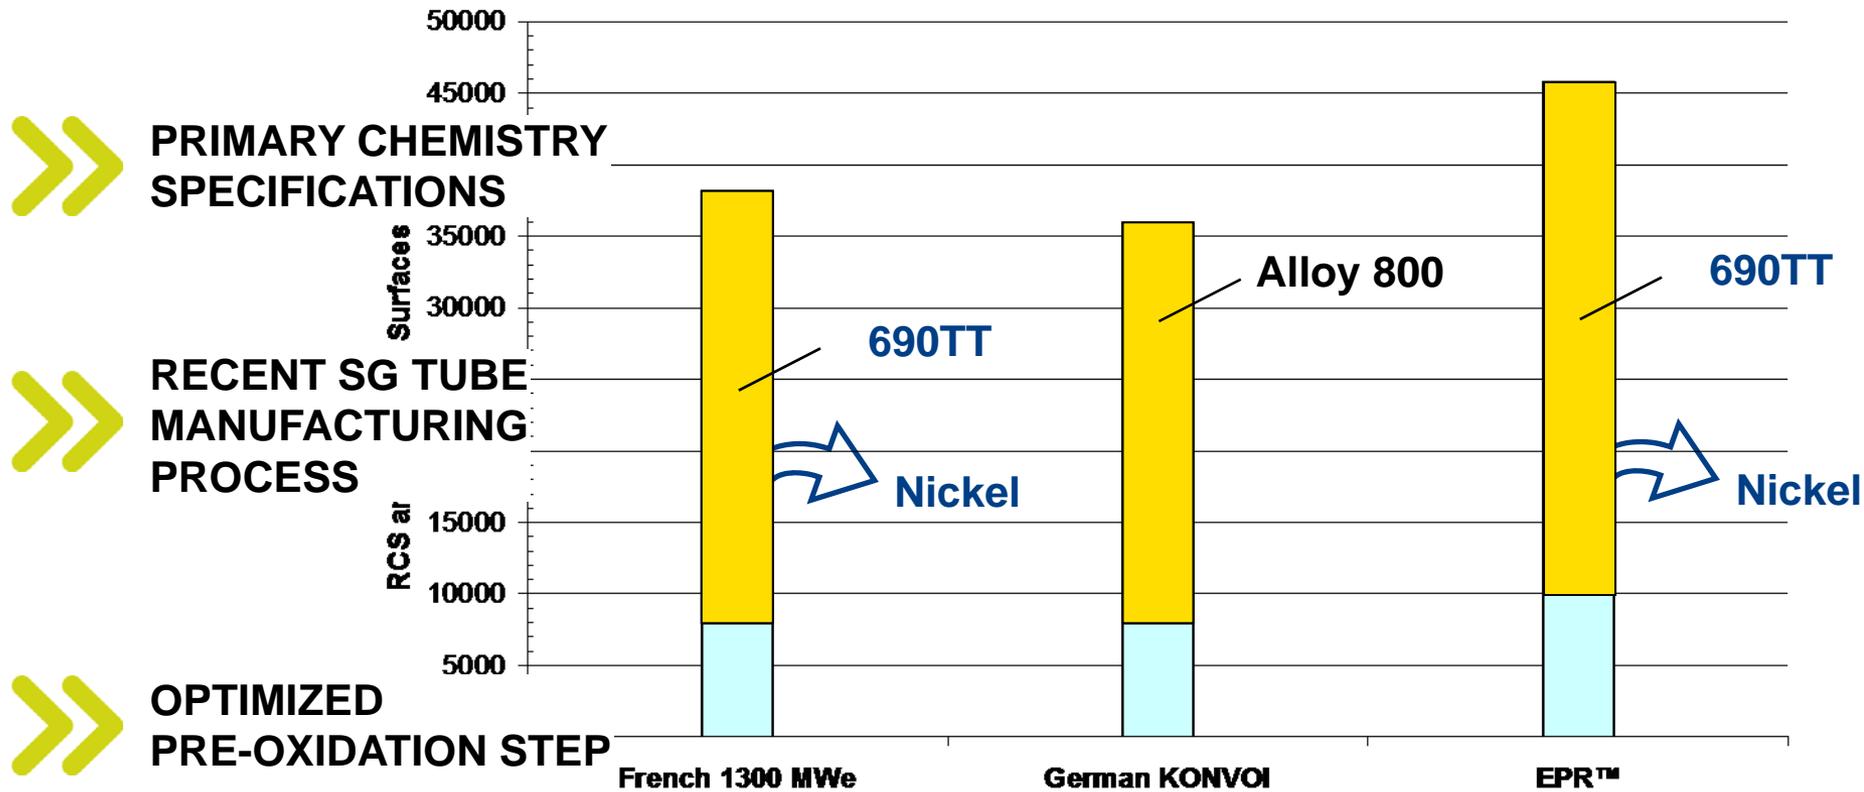

**ALARA OPTIMIZATION WITH MORE RESTRICTIVE VALUES THAN REQUIRED**

**ENGINEERING & PROJECTS ORGANIZATION**

# Potential Cobalt-58 Sources from Nickel in SG Tubes and Steel Surfaces

- ▶ **EPR™ RCS component surfaces**
  - ◆ Different choice for SG tubes than on reference KONVOI series (integrated decision)
- ▶ **Nickel potential release has to be mitigated by all ALARA means**

ENGINEERING & PROJECTS ORGANIZATION

□ Zr-based □ RCS wetted components

# EPR™ Expected Deposit Dose Rates?

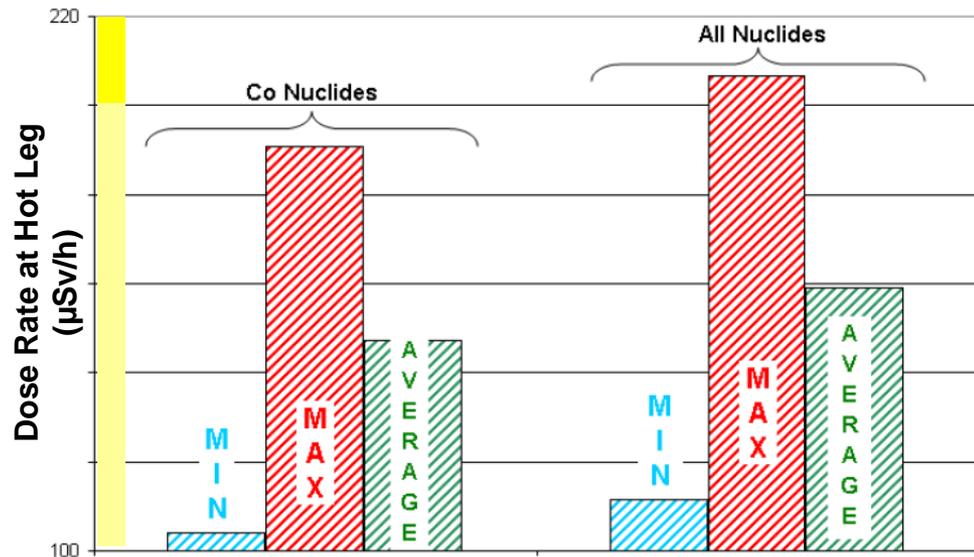

- ▶ Given the current material inventory on EPR™, RCS dose rates due to corrosion product deposits are assumed to be driven
  - ◆ By Cobalt-58, approximately 50%
  - ◆ By Cobalt-60, approximately 40%, due to decrease in Cobalt inventory
- ▶ Remaining 10% are due to radioactive Iron and Manganese
  - ◆ Silver and Antimony in bearings and gaskets are suppressed or avoided

## ▶ RCS expected dose rates?

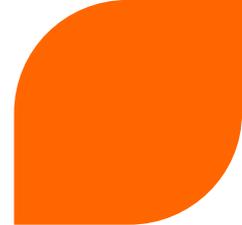

- ◆ < 200  $\mu\text{Sv/h}$
- ◆ Ageing covered
- ◆ Valid for several reactor states

**AS LOW AS ON BEST EXISTING UNITS**

**ENGINEERING & PROJECTS ORGANIZATION**

# Are Further Improvements in Material Inventory ALARA?

1. *Introduction*
2. *Activity Build-Up on Primary Component Surfaces*
3. *Impact of Current EPR™ Material Inventory on Primary Circuit Contamination*
4. ***Are Further Improvements in Material Inventory ALARA?***
5. *Conclusion*

# Continuous Improvement

- ▶ **Several design iterations have been performed during 15 years**
  - ◆ Already integrated optimization of current EPR™ material choices

## **BUT**

- ▶ **Further design changes have to be considered anyway**
  - ◆ ALARA approach should be continuously questioned by designers
  - ◆ Requests from Customers towards lower potential radiation sources
  - ◆ Different regulatory or Safety documentation can impose local rules
- ▶ **Development of a calculation “decision-making” tool for Cobalt-60 potential sources**
  - ◆ Wetted surfaces and material release rates/ wear
  - ◆ Component location (under/ outer neutron flux – RCS/ auxiliary system)
  - ◆ Benchmark of the tool with in-situ Cobalt-60 activity measurements on reference plants

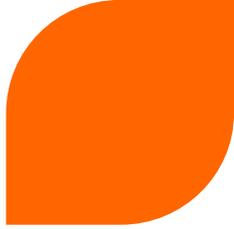

# Design Changes Involving Cobalt Inventory

- ▶ **Impact on ORE expected in a range between negligible and some percents**
  - ◆ **Less or no Stellite™ in RPV internals: minus 2-3% on the total ORE**
  - ◆ **No Stellite™ in CRDMs: minus 3-5% on the total ORE**
  - ◆ **No Stellite™ in MCPs: negligible**
  - ◆ **Lower Cobalt residual content in RCS steels : minus 5-6% on the total ORE**
- ▶ **Industrial/ operational risks or sacrifices in comparison?**
  - ◆ **Costs (e.g. generalized low cobalt content, less than 0.05% in steels, ...)**
  - ◆ **Absence of qualified Cobalt-free materials for some applications involving high design mechanical loads or severe transients**
  - ◆ **Increased outage duration and personnel doses in case of early replacements**
  - ◆ **Safety issue in case of safety equipment mechanical degradation**

**A CASE BY CASE ANALYSIS IS NECESSARY BEFORE IMPLEMENTING**

**ENGINEERING & PROJECTS ORGANIZATION**

# Conclusion

1. *Introduction*
2. *Activity Build-Up on Primary Component Surfaces*
3. *Impact of Current EPR™ Material Inventory on Primary Circuit Contamination*
4. *Are Further Improvements in Material Inventory ALARA?*
5. **Conclusion**

# Conclusion

- ▶ **The current EPR™ design follows the ALARA approach with regard to material selection**
  - ◆ Cobalt-free materials in all RCS valves
  - ◆ Minimum Stellite™ surfaces in RPV internals
  - ◆ No corrosion and wear expected for remaining parts with Stellite™ hardfacing
  - ◆ Limitation of Cobalt residual content in primary components
  - ◆ Avoidance of other potential corrosion product sources (Silver, Antimony)
- ▶ **Complementary means are implemented to decrease doses ALARA**
  - ◆ Primary chemistry specification
  - ◆ Latest SG manufacturing process ensuring low release rates of Nickel
  - ◆ Optimized pre-oxidation step during commissioning
- ▶ **EPR will have low dose rates and ORE values close to best existing plants**
- ▶ **Other dose reduction measures have to be analyzed case by case**

**SOME CHANGES MIGHT BECOME MORE “REASONABLE” IN THE FUTURE**

**ENGINEERING & PROJECTS ORGANIZATION**

**Thank you for your attention...**

# Design Changes Involving Nickel Inventory

- ▶ **Change of the SG tube material from Alloy 690TT to Alloy 800?**
  - ◆ **EPR™ already has low ORE values between 0.35 and 0.5 man-Sv/y on average over 60 years**
  - ◆ **On one hand, plants of existing fleets with Alloy 690TT as SG tube material already exhibit a good behavior regarding Nickel release and fulfill the above EPR™ values of ORE**
    - Primary chemistry
    - SG tube manufacturing process of recent plants follows the “state-of-the-art”
  - ◆ **On the other hand, occupational doses in the same range as for KONVOI units may be achievable with this design change**
- ▶ **Industrial/ operational risks or sacrifices in comparison?**
  - ◆ **International word-wide experience is in favor of Alloy 690TT regarding the number of Nuclear Power Plants in operation**
  - ◆ **Suspicion of corrosion issues on Alloy 800 in certain chemical environments in the secondary side [*international corrosion expert opinion*]**
  - ◆ **Cost of early SG repairs or replacement (outage duration, additional dose)**
